Question Q.1.a 程序代写代做 CS编程辅导

Explain why a Pulse Position Modulation (PPM) system requires the transmission of a synchronous signal, whereas a single channel Pulse Amplitude Modulation (PAM) or Pulse Width Modulation (PWM) system does not.

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Solution Q.1.a

程序代写代做 CS编程辅导

PPM requires synchronisation because the information is contained in the position of the pulse with respect to reference time. However, the reference time is not available with the transmitted pulse hence this requires additional synchronisation. In PWM, the information is contained in the width of the pulse and the start and end can be obtained from the rising and falling edges of the pulses. In PAM the information is contained in the amplitude and thus the pulses position is not influenced.

Question Q.1.b 程序代写代做 CS编程辅导

Binary data are transmitted by a pulse $s(t)$ for 0 and a pulse $3s(t)$ for 1. Show that the optimum receiver for this case is a filter matched to $s(t)$ with a detection threshold $2E_s$ as shown in Figure Q.1. Assume that 0 and 1 are equiprobable, determine the probability of error of this receiver as a function of E_s/N where N is the noise power of additive white Gaussian noise with zero mean as expressed in equation (1.1).

$$p(v) = \frac{1}{\sqrt{2\pi\sigma_v^2}} \exp\left(-\frac{v^2}{2\sigma_v^2}\right)$$

and the noise power $N=\sigma_v^2$

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Solution Q.1.b

程序代写代做 CS编程辅导

The optimum receiver is the matched filter with the signal component being equal to the convolution with the impulse response of the filter, thus when input is $s(t)$, the output at $t=T$ is equal to E_s , whereas when input is $3s(t)$, the output at $t=T$, is equal to $3E_s$.

WeChat: cstutorcs

Thus to discriminate the 1 and 0, we set the threshold in the middle at $2E_s$.

Email: tutorcs@163.com

An error will occur if transmitted signal is a mark and $n_0(t) < -E_s$ since the output signal will fall below $2E_s$; this is referred to as a miss; or if the transmitted signal is a space and $n_0(T) > +E_s$, since the output signal will be greater than $2E_s$ this is referred to as false alarm.

QQ: 749389476

Question Q.1.c 程序代写代做 CS编程辅导

Five messages bandlimited to W , $2W$, $4W$, and $4W$ Hz, respectively are to be time-division multiplexed. Devise a commutator configuration such that each signal is periodically sampled at its own minimum transmission rate and the samples are properly interlaced. What is the minimum transmission bandwidth required for this Time Division Multiplexing (TDM) signal?

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Solution Q.1.c

程序代写代做 CS编程辅导

W , W , $2W$, $4W$, and $4W$ Hz,

For the above signals, the first signal needs to be sampled at $2W$, the third at $4W$, and the fourth and fifth at $8W$.

So for each sample of the first signal $S1$ and second signal $S2$, 2 samples are needed for the 3rd signal $S3$, and 4 samples are needed for the 4th and 5th signals, $S4$ and $S5$.

A possible interleaving is as follows:

$S1 S4 S5 S3 S4 S5 S2 S4 S5 S3 S4 S5 S1 S4 S5 S3 S4 S5 S2 S4 S5 S3 S4 S5$

Total number of samples in one cycle is equal to: $2+2+4+8+8= 24$.

So the bandwidth needed is $12W$.

Question Q.1.d 程序代写代做 CS编程辅导

A baseband transmission transmits the Manchester code where binary 1 is represented by the first half of the bit duration and $-V$ for the second half. Determine the correlation coefficient between the two baseband signals representing the one and the zero.

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Solution Q.1.d

程序代写代做 CS编程辅导

The one is $+V$ for first half and $-V$ for the second half. For the zero it will be $-V$ for the first half of the bit and $+V$ for the second half of the bit. So the representation of the zero is -1 of the one bit. This gives a correlation coefficient of -1 .

Question Q.1.e 程序代写代做 CS编程辅导

- Give the output of a Phase Locking (PSK) correlation detector if the stored replica has identical frequency as the incoming signal but has a phase offset equal to $\Delta\phi$. Comment on the result.

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Solution Q.1.e

程序代写代做 CS编程辅导

Replica at the receiver

$$\cos(2\pi f_o t + \Delta\phi)$$

The product in the correlation detector gives

$$p(t) = A\cos(2\pi f_o t + \Delta\phi) \cdot A\cos(2\pi f_o t) = A^2/2(\cos(4\pi f_o t + \Delta\phi) + \cos\Delta\phi)$$

This is then followed by the integrator which gives

$$\frac{A^2T}{2} \cos\Delta\phi$$

Email: tutorcs@163.com

QQ: 749389476

When the phase difference is zero we get the optimum output. For all other values the output is less than the optimum and gives a higher error rate and can give zero output when the phase difference is as large as 90 degrees.

Question Q.2.a 程序代写代做 CS编程辅导

A transmitter produces 100 W of power which are applied to a unity gain antenna at 2 GHz frequency.

- (i) Express the transmitter power in dBm and dBW.
- (ii) Rewrite the free space equation given in equation (2.1)
- (1) to express the free space path loss in dB
- (2) to give the ratio of received powers at two distances, d_1 and d_2 .
- (iii) Find the received power in dBm at a free space distance of 10 m and 1 km from the transmit antenna. Assume unity gain for the receive antenna.

Question Q.2.a cont

程序代写代做 CS编程辅导

Free space propagation equation is given by

$$\frac{P_R}{P_T} = G_T G_R \left(\frac{c}{4\pi f d} \right)^2$$

WeChat: cstutorcs

Assignment Project Exam Help

where P_T and P_R are the transmit and receive powers, respectively, c is the speed of light, G_T and G_R are the gains of the transmit and receive antennas, respectively, f is frequency and d is distance.

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Solution Q.2.a

程序代写代做 CS编程辅导

$$10\log_{10}(10) = 10 \text{ dBW}$$

To convert to dBm we add 30 dBm or evaluate $10\log_{10}(10,000) = 40 \text{ dBm}$

Free space equation can be rewritten as

$$L = 10\log_{10} \frac{P_R}{P_T} = 10\log_{10} G_T + 10\log_{10} G_R - 20\log_{10} f - 20\log_{10} d + k$$

$$k = 20\log_{10} \frac{c}{4\pi} = 147.6$$

free space equation can be rewritten as $\frac{P_r(d_2)}{P_r(d_1)} = \left(\frac{d_1}{d_2}\right)^2$

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Frequency bands	frequency range
Extremely Low Frequency (ELF)	< 3 kHz
Very Low Frequency (VLF)	3-30 kHz
Low Frequency	30-300 kHz
Medium Frequency	300 kHz-3 MHz
High Frequency	3-30 MHz
Very High Frequency (VHF)	30-300 MHz
Ultra High Frequency (UHF)	300 MHz-3 GHz
Super High Frequency (SHF)	3-30 GHz
Extra High Frequency (EHF)	30-300 GHz

Table 1

Solution Q.2.b

程序代写代做 CS编程辅导

Modes of radio-wave propagation

Ionospheric or Sky-waves

Tropospheric waves

Ground waves which can be

(i) Space waves which can be Direct waves or Ground-reflected waves

(ii) Surface waves

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Waves travelling via the ionosphere which is an ionised region of the atmosphere extending above the earth from about 60 –500 km are termed sky-wave whereas waves travelling via the lower parts of the atmosphere (below 17 km) are termed tropospheric waves and forward scatter may be used for long range propagation of waves between about 300 MHz and 10 GHz.

Solution Q.2.b. cont

VLF waves are transmitted via waveguide effect formed between the D-layer (the lower part of the ionosphere) and the earth and is used to transmit worldwide telegraphy, navigation and communication with submerged submarine since higher frequencies get rapidly attenuated in water. LF and MF propagate via ground wave where LF is mainly a surface wave and is used for navigation, and MF is normally surface wave in the day and skywave via the D-layer at night (AM radio). VHF and UHF propagation is mainly space wave including both ground-reflected and direct waves.

QQ: 749389476

<https://tutorcs.com>

Solution Q.2.b. cont

SHF is usually termed microwave which also includes frequencies above 1.5 GHz and is mainly line of sight (LOS). This band is used for satellite communication, short range communications and point to point radio links. Finally, the EHF band is termed as millimetre wave band and permits the use of very large bandwidths where propagation is mainly by LOS and ground reflection is insignificant due to losses. Only over very smooth grounds or water surfaces does ground reflection become significant. These frequencies are affected by scattering in rain and snow and at certain frequencies absorption by fog, water vapour and other atmospheric gases. These frequency bands are mainly used for very short secure communication systems for example at 60 GHz.

Solution Q.2.c

程序代写代做 CS编程辅导

Handoff: When a mobile phone moves into a different cell while a conversation is in progress, the Mobile Switching Centre automatically transfers the call to a new channel belonging to the new base station. This handoff operation involves:

WeChat: cstutorcs

Assignment Project Exam Help

identifying a new base station, and

Email: tutorcs@163.com

allocation of voice and control signals to channels associated with the new base station.

QQ: 749389476

<https://tutorcs.com>

Solution Q.2.c

程序代写代做 CS编程辅导

Hard and soft Handoff: Code division multiple access (CDMA) spread spectrum cellular systems IS-95 provides a unique handoff capability that cannot be provided with other wireless systems. Unlike channelised wireless systems that assign different radio channels during a handoff (called a hard handoff), spread spectrum mobiles share the same channel in every cell. Thus, the term handoff does not mean a physical change in the assigned channel, but rather that a different base station handles the radio communication task.

Solution Q.2.c cont

程序代写代做 CS编程辅导

By simultaneously evaluating the received signals from a single subscriber at several neighboring base stations, the MSC may actually decide which version of the user's signal is best at any moment in time. This technique exploits macroscopic space diversity provided by the different physical locations of the base stations and allows the MSC to make a soft decision as to which version of the user's signal to pass along to the PSTN at any instance. The ability to select between the instantaneous received signals from a variety of base stations is called soft handoff.

Question 2.d

程序代写代做 CS编程辅导

Discuss the causes of co-channel interference in cellular networks.

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Solution Q.2.d

程序代写代做 CS编程辅导

Co-channel interference:

Frequency reuse implies that in a given coverage area there are some cells that use the same set of frequencies. These cells are called *co-channel cells*, and the interference between signals from these cells is called *co-channel interference*. Unlike thermal noise, which can be overcome by increasing the signal-to-noise ratio (SNR), co-channel interference cannot be combated by simply increasing the carrier power of a transmitter. This is because an increase in carrier transmitted power increases the interference to neighbouring co-channel cells. To reduce co-channel interference, co-channel cells must be physically separated by a minimum distance as illustrated in figure
